

1. I dropped the derived attributes: return_date, amount_due, and status because they can be computed from the data rather than being stored (to avoid data redundancy).
2. Each subtype of Car only contains Vid as the primary key and foreign key referencing Car. Since the specialization is disjoint, a car can only belong to one subtype at a time (e.g., a car cannot be both an SUV and a truck). Additionally, Compact, Mid, and Large are kept as direct subtypes of Car rather than subtype of SUV as depicted in the HW2 solution.
3. The “Rent” relation is mapped with a composite primary key of (cust_id, Vid, Rid), since it was an M:N:P relationship.
4. Daily and Weekly relations carry “Rid” as the primary key and foreign key to reference the id in Rental. Additionally, the Daily and Weekly also have their attributes: no_of_days and no_of_weeks, respectively.
